Your soul

1.1) Why would you like to learn coding & scripting?

To improve my understanding of web technologies as I had been extensively working on the internet for my previous role and that curiosity has remained. Additionally, this knowledge would be useful for my daily job to better understand development side of things in general (after all, programming languages have similarities) - I really need to enhance my technical skills.

1.2) How and where will you use gained knowledge?

I believe that knowing some more programming will help me better perform at my daily job – there must be some general concepts that work just like the laws of Physics, so will be easier to imagine how things work behind UI etc. Furthermore, I am sure it will make it easier to learn other scripting languages in the future.

1.3) Have you had any previous experience related to computer science/IT? Please

describe it.

I have minimal such experience. Have basic knowledge of HTML, PostgreSQL, some CSS. I worked for more than a year at service desk, now it's been about five months in Trading Support team.

1.4) Do you have a dream project which this training would allow you to complete?

I have always wanted to be able to create an interactive e-commerce website (items for people that love cats) and the ultimate goal would be a perfect flight search engine finding the best deals online.
